The option is easy to use.

People who use Google Maps to find a physical space can see all information on accessibility.

Google Maps aims to identify physical places that are accessible to people with reduced mobility. For this it has opened a category in the contribution option on its maps.

In early July, [Google published a post on its blog](#), announcing the option to **describe a specific spot as accessible on Google Maps**. This idea emerged thanks to Luis Duran, a tour guide from the Dominican Republic. Luis Duran has always **strived to help people with reduced mobility** so they can visit his country in the best conditions possible.

The option is easy to use. After entering [Google Maps](#), you enter «**my contributions**». From here you can add information on how accessible a space is. This information **may be categorized** using the following terms:

- Adapted access for wheelchairs.
- Elevators for wheelchairs.
- Space reserved for wheelchairs.
- Parking place reserved for people in a wheelchair.

After entering the information, people who use [Google Maps](#) to find a physical space can see all information on accessibility. With this information, **users can visit the space and even ask for the space to be made more accessible**.
